

Title: Assuria Log Manager – Release 3.5.3
Number: 10-07 Date: 8 March 2010

Title Assuria Log Manager – Release 3.5.3

Introduction The Bulletin introduces the latest generally release of Assuria Log Manager Version 3.5.3 which is available for download from AssuriaOnline.

Assuria has adopted a more 'agile' approach to the development and release of Assuria Log Manager (ALM) and new releases of ALM will be made approximately monthly.

New features at ALM 3.5.3. release

ALM 3.5.3 is released to introduce new agents and underlying product functionality and improvements.

New features at this 3.5.3.release include:

- Log re-analyser
- Randomised log collection
- IBM AIX 5 audit data-source
- Administrative reports

Existing ALM users should contact Assuria for information on upgrading to this release.

Log re-analyser

The Log Re-analyser enables the user to select Datasets to be Re-analysed. The datasets to be re-analysed can be filtered by Agent and log-type as well as a 'From date' and a 'To date' and a maximum number of datasets. The datasets to be Re-analysed are queued in the subscriber queue.

Randomised log collection

The randomised log collection feature enables a user to specify that logs can be collected 'hourly' or 'daily' from a number of agents but not specify the hour or minutes past the hour for each agent. ALM will randomise the collection time from each agent.

IBM AIX 5 audit datasource

A data-source is now available for the IBM AIX 5 audit subsystem.

Administrative reports

Three new administrative reports have been added to help with the overall management of an ALM installation. The new reports are:

- Agents failed to connect to a Collector
- Clock discrepancy between agent and collector
- Obsolete agents connected to a Collector

Standard data sources.

For a complete list of supported data-sources please contact Assuria.

Further information

For further information about Assuria Log Manager please contact Assuria.
